Rubber Bucky Project

This project is how to add some posability to a rubber skeleton. Just need some wire and wooden dowels,drill with drill bit and something to cut the wood with.

Cut the rubber guy to pieces.
Remove the head and both arms and legs.

Take apart every part of both arms and legs as well. Lace the torso together

I added some wire to the hands to make them pose able. Just this one step made the guy look more real already

You can see how good the hand looks now with the wire.

Add dowels to arms and legs. They should just slid in.

You can now see how well the once floppy guy now will sit up on his own.
